

Introduction to Language Theory and Compilation Solutions

Session 9: Semantic Analysis

Solutions

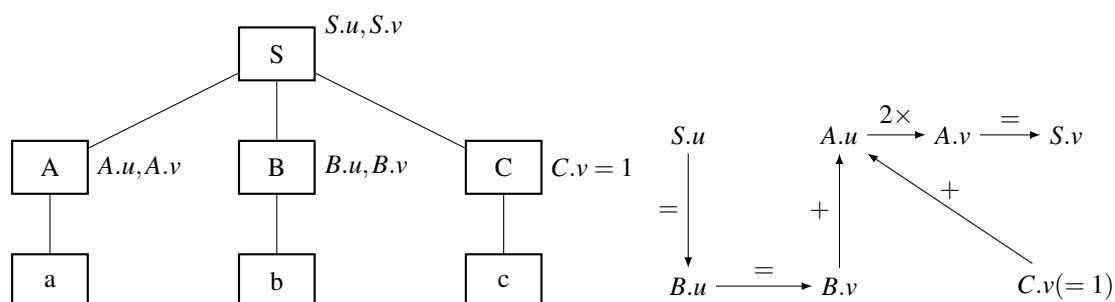

Ex. 1. Write the expression tree decorated with the type of each node.

where types are written in typewriter font in superscript (e.g. Int^{int})

	Grammar rules	Semantic Rules
Ex. 2. $\langle S \rangle \rightarrow \langle A \rangle \langle B \rangle \langle C \rangle$		$B.u = S.u \mid A.u = B.v + C.v \mid S.v = A.v$
$\langle A \rangle \rightarrow a$		$A.v = 2 * A.u$
$\langle B \rangle \rightarrow b$		$B.v = B.u$
$\langle C \rangle \rightarrow c$		$C.v = 1$

1. Draw the parse tree for the input abc , (the only string for the language), and show the dependency graph for the associated attributes.

Describe one correct order for the evaluation of the attributes: $S.u, B.u, B.v, C.v, A.u, A.v, S.v$.

2. Assume that $S.u$ is assigned the value of 3 before starting attribute evaluation. What will be the value of $S.v$ when evaluation has terminated?

$$S.u = 3 \Rightarrow B.u = S.u = 3 \Rightarrow B.v = B.u = 3 \Rightarrow A.u = B.v + C.v = 3 + 1 = 4 \Rightarrow A.v = 2 \times A.u = 2 \times 4 = 8 \Rightarrow S.v = A.v = 8$$

3. Consider now the same grammar with different semantic rules :

	Grammar rules	Semantic Rules
$\langle S \rangle \rightarrow$	$\langle A \rangle \langle B \rangle \langle C \rangle$	$B.u = S.u \mid A.u = B.v + C.v \mid S.v = A.v \mid C.u = A.v$
$\langle A \rangle \rightarrow$	a	$A.v = 2 * A.u$
$\langle B \rangle \rightarrow$	b	$B.v = B.u$
$\langle C \rangle \rightarrow$	c	$C.v = C.u - 2$

Can you evaluate $S.v$?

No, there is a circular dependency pattern :

- Ex. 3.** 1. Rewrite the following grammar in order to account for operator precedence and associativity:

$$\begin{aligned} \langle E \rangle &\rightarrow \langle E \rangle \langle \text{op} \rangle \langle E \rangle \mid (\langle E \rangle) \mid \text{int} \\ \langle \text{op} \rangle &\rightarrow + \mid - \mid * \mid / \end{aligned}$$

$$\begin{aligned} \langle E \rangle &\rightarrow \langle E \rangle + \langle T \rangle \mid \langle E \rangle - \langle T \rangle \mid \langle T \rangle \\ \langle T \rangle &\rightarrow \langle T \rangle * \langle F \rangle \mid \langle T \rangle / \langle F \rangle \mid \langle F \rangle \\ \langle F \rangle &\rightarrow (\langle E \rangle) \mid \text{int} \end{aligned}$$

2. Associate the rules and attributes necessary to compute the value of an expression E.

$$\begin{aligned} \langle E \rangle &\rightarrow \langle E \rangle : e_1 + \langle T \rangle & \{E.val \leftarrow e_1.val + T.val\} \\ &\rightarrow \langle E \rangle : e_1 - \langle T \rangle & \{E.val \leftarrow e_1.val - T.val\} \\ &\rightarrow \langle T \rangle & \{E.val \leftarrow T.val\} \\ \langle T \rangle &\rightarrow \langle T \rangle : t_1 * \langle F \rangle & \{T.val \leftarrow t_1.val * F.val\} \\ &\rightarrow \langle T \rangle : t_1 / \langle F \rangle & \{T.val \leftarrow t_1.val / F.val\} \\ &\rightarrow \langle F \rangle & \{T.val \leftarrow F.val\} \\ \langle F \rangle &\rightarrow (\langle E \rangle) & \{F.val \leftarrow E.val\} \\ &\rightarrow \text{int} & \{F.val \leftarrow \text{int}.val\} \end{aligned}$$

Finally, remove left recursion from the grammar:

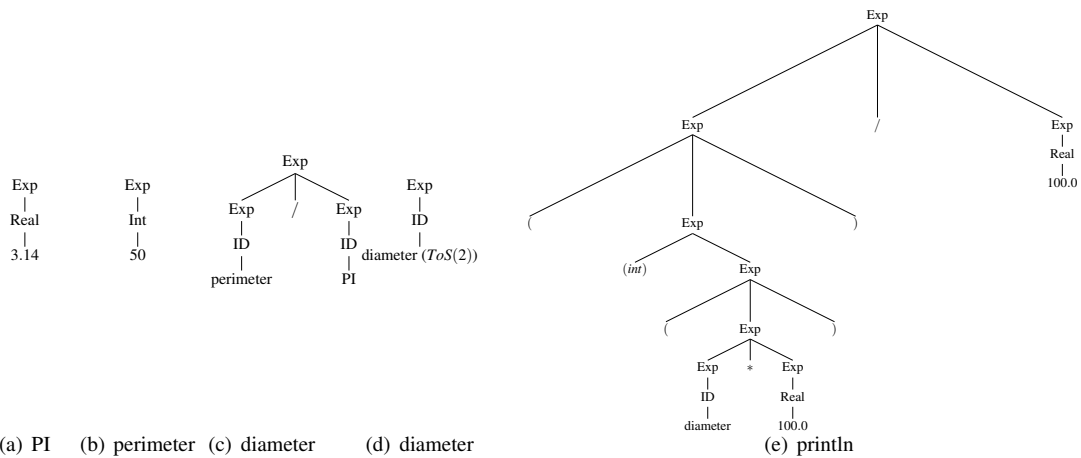

$\langle E \rangle$	\rightarrow	$\langle T \rangle$	$\{E'.h \leftarrow T.val\}$
		$\langle E' \rangle$	$\{E.val \leftarrow E'.s\}$
$\langle E' \rangle$	\rightarrow	$+$	
		$\langle T \rangle$	$\{e_1.h \leftarrow E'.h + T.val\}$
		$\langle E' \rangle: e_1$	$\{E'.s \leftarrow e_1.s\}$
	\rightarrow	$-$	
		$\langle T \rangle$	$\{e_1.h \leftarrow E'.h - T.val\}$
		$\langle E' \rangle: e_1$	$\{E'.s \leftarrow e_1.s\}$
	\rightarrow	ϵ	$\{E'.s \leftarrow E'.h\}$
$\langle T \rangle$	\rightarrow	$\langle F \rangle$	$\{T'.h \leftarrow F.val\}$
		$\langle T' \rangle$	$\{T.val \leftarrow T'.s\}$
$\langle T' \rangle$	\rightarrow	$*$	
		$\langle F \rangle$	$\{t_1.h \leftarrow T'.h * F.val\}$
		$\langle T' \rangle: t_1$	$\{T'.s \leftarrow t_1.s\}$
$\langle T' \rangle$	\rightarrow	$/$	
		$\langle F \rangle$	$\{t_1.h \leftarrow T'.h / F.val\}$
		$\langle T' \rangle: t_1$	$\{T'.s \leftarrow t_1.s\}$
	\rightarrow	ϵ	$\{T'.s \leftarrow T'.h\}$
$\langle F \rangle$	\rightarrow	$(\langle E \rangle)$	$\{F.val \leftarrow E.val\}$
	\rightarrow	int	$\{F.val \leftarrow int.val\}$

Where $V.h$ denotes an *inherited* attribute, while $V.s$ denotes a *synthesized* attribute. Be careful here: the right-hand sides can carry over several lines. For instance the first rule is the following :
 $\langle E \rangle \rightarrow \langle T \rangle \{E'.h \leftarrow T.val\} \langle E' \rangle \{E.val \leftarrow E'.s\}$

Ex. 4. • Give the table of symbols (ToS)

UID	Name	Context	Initialization	Type
1	PI	Exercise3 class	3.141592653589793	<i>double</i>
2	diameter	Exercise3 class	/	<i>double</i>
3	args	main function class	parameter	<i>String[]</i>
4	perimeter	main function class	50	<i>double</i>
5	diameter	main function	ToS(2)	<i>int</i>

- Give the parse tree of each numerical expression

- Annotate the parse trees with changes of the table of symbols

We add these operations in the root of the trees:

PI (a) $ToS(1) \leftarrow result(Exp)$

perimeter (b) $ToS(4) \leftarrow result(Exp)$

diameter (c) $ToS(2) \leftarrow result(Exp)$

diameter (d) $ToS(5) \leftarrow result(Exp)$

println (e) /

- Report any semantic error.

Line 7: the global diameter is a double and the local diameter is an integer. A cast operator is required. This error occurs at the root of the tree (d).
